33,554,432-BIT (4,194,304-WORD BY 8-BIT /2,097,152-WORD BY 16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

DESCRIPTION

The M5M29KB/T331AVP are 3.3V-only high speed 33,554,432-bit CMOS boot block FLASH Memories with alternating BGO(Back Ground Operation) feature. The BGO feature of the device allows Program or Erase operations to be performed in one bank while the device simultaneously allows Read operations to be performed on the other bank.

This BGO feature is suitable for mobile and personal computing, and communication products.

The M5M29KB/T331AVP are fabricated by CMOS technology for the peripheral circuit and DINOR IV(Divided bit-line NOR IV) architecture for the memory cell, and are available in 48pin TSOP(I) for lead free use.

M5M29KB/T331AVP provides for Software Lock Release function. Usually, all memory blocks are locked and can not be programmed or erased, when WP# is low. Using Software Lock Release function, program or erase operation can be executed.

FEATURES

Access time	Random	70ns (Max.)
	Page	25ns(Max.)
Supply voltage		VCC= 3.0 ~ 3.6V
Ambient temperature		Ta=-40 ~ 85 °C
Package	48pin TSOP(Type-I), Lead pitch 0.5mm	
	Outer-lead finishing : Sn-Cu	

APPLICATION

Digital Cellar Phone, Telecommunication,
PDA, Car Navigation System, Video Game Machine

PIN CONFIGURATION (TOP VIEW)

VCC : VCC
GND : GND
A0-A21 : Address
DQ0-DQ15 : Data I/O
CE# : Chip enable
OE# : Output enable

WE# : Write enable
WP# : Write protect
RP# : Reset power down
BYTE# : Byte enable

Flash Memory Part**Description**

The 32M-bit DINOR IV(Divided bit line NOR IV) Flash Memory is 3.3V-only high speed 33,554,432-bit CMOS boot block Flash Memory. Alternating BGO(Back Ground Operation) feature of the device allows Program or Erase operations to be performed in one bank while the device simultaneously allows Read operations to be performed on the other bank. This BGO feature is suitable for communication products and cellular phone. The Flash Memory is fabricated by CMOS technology for the peripheral circuits and DINOR IV architecture for the memory cells.

Features

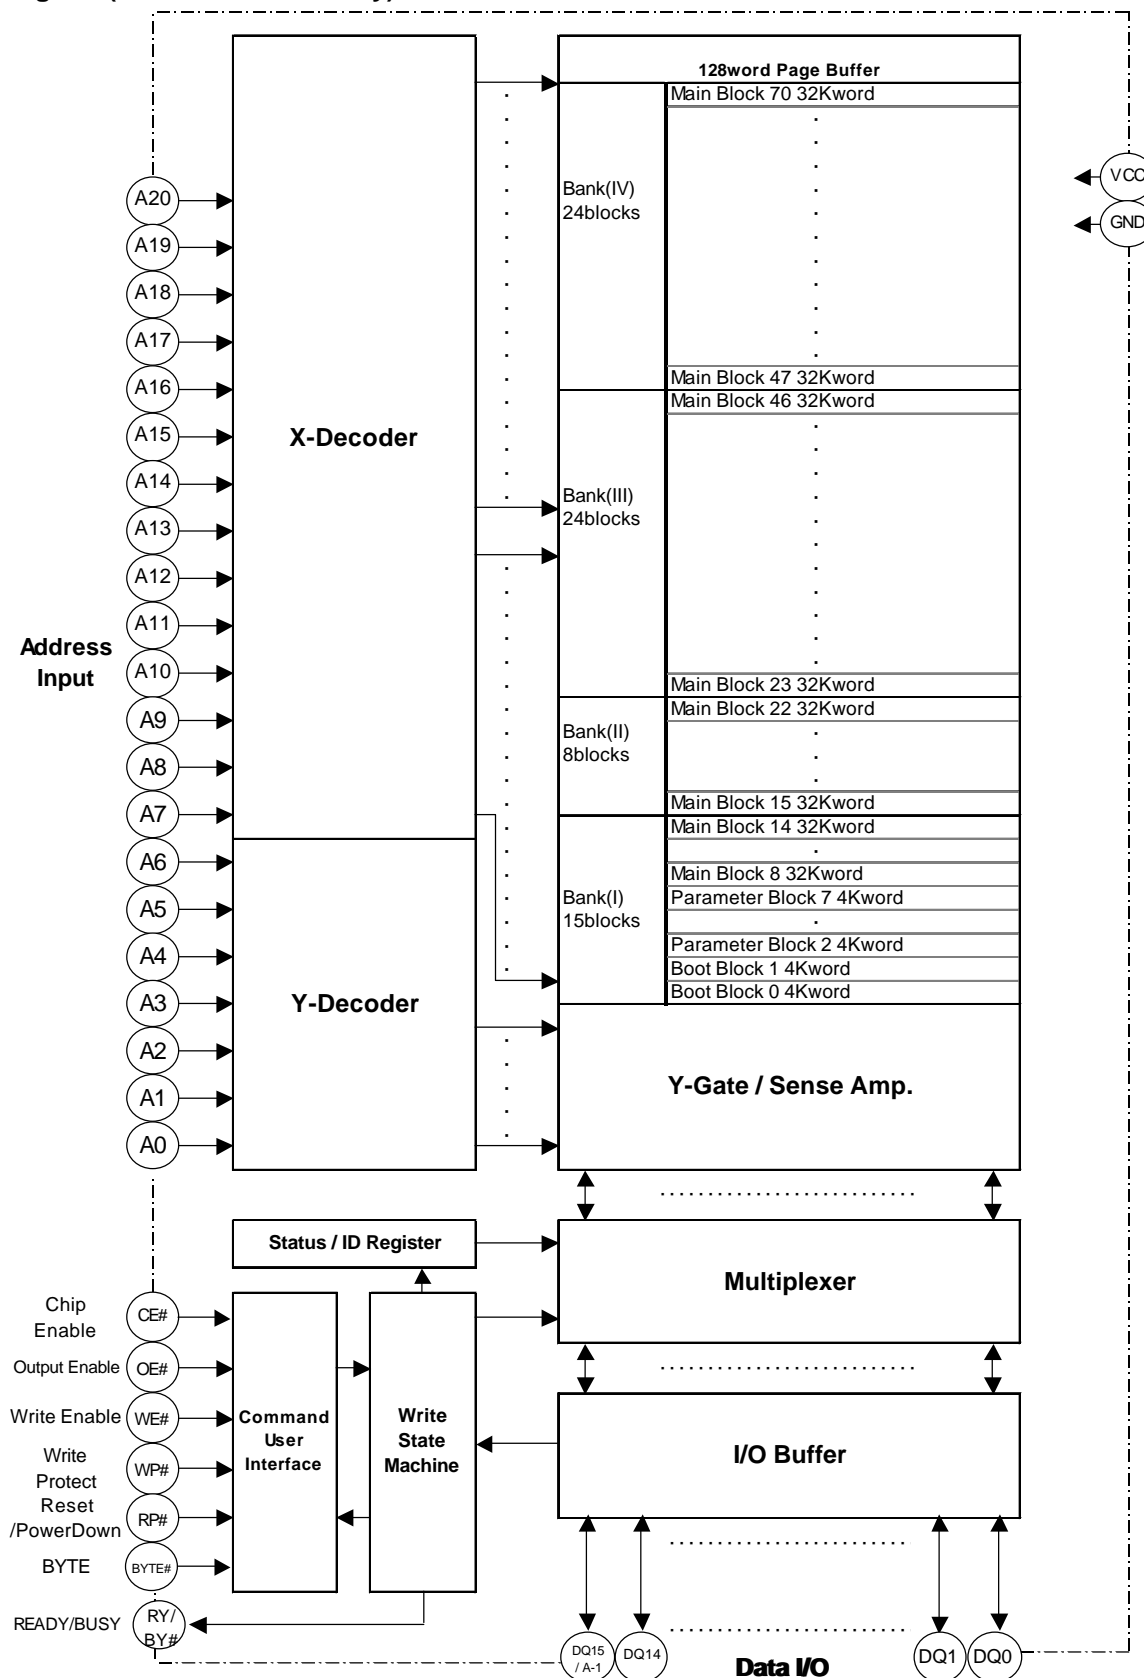

-Organization	2,097,152-word x 16-bit 4,194,304-byte x 8-bit
- Supply Voltage	VCC = 3.0 ~ 3.6V
- Access time	
Random Access	70ns(Max.)
Random Page Read	25ns(Max.)
- Read	108mW (Max. at 5MHz)
- Page Read	36mW (Max.)
(After Automatic Power Down)	0.33μW(typ.)
- Program/Erase	126mW(Max.)
Standby	0.33μW(typ.)
Deep Power Down mode	0.33μW(typ.)
- Auto Program for Bank(I) – Bank(IV)	
Program Time	
Word Program	30μs/word(typ.)
Byte Program	30μs/byte(typ.)
Page Program	4ms(typ.)
Program Unit	
Word/Byte Program	1word/ 1Byte
Page Program	128 words/ 256 bytes

- Auto Erase		
Erase time	Main Block	150ms/block (typ.)
Erase unit		
Bank(I)		
	Boot Block	4K-word x2/ 8K-byte x2
	Parameter Block	4K-word x6 / 8K-byte x6
	Main Block	32K-word x7 / 64K-byte x7
Bank(II)	Main Block	32K-word x8 / 64K-byte x8
Bank(III)	Main Block	32K-word x24 / 64K-byte x24
Bank(IV)	Main Block	32K-word x24 / 64K-byte x24

33,554,432-BIT (4,194,304-WORD BY 8-BIT /2,097,152-WORD BY 16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

Function of Flash Memory

The 32M-bit DINOR IV Flash Memory includes on-chip program/erase control circuitry. The Write State Machine (WSM) controls block erase and word/page program operations. Operational modes are selected by the commands written to the Command User Interface (CUI). The Status Register indicates the status of the WSM and when the WSM successfully completes the desired program or block erase operation.

A Deep Power Down mode is enabled when the RP# pin is at GND, minimizing power consumption.

Read

The 32M-bit DINOR IV Flash Memory has four read modes, which accesses to the memory array, the Page Read, the Device Identifier and the Status Register. The appropriate read commands are required to be written to the CUI. Upon initial device power up or after exit from deep power down, the 32M-bit DINOR IV Flash Memory automatically resets to read array mode. In the read array mode and in the conditions are low level input to OE#, high level input to WE# and RP#, low level input to CE# and address signals to the address inputs (A20 - A0: Word mode / A20-A-1: Byte mode) the data of the addressed location to the data input/output (DQ15-DQ0: Word mode / DQ7- DQ0: Byte mode) is output.

Write

Writes to the CUI enables reading of memory array data, device identifiers and reading and clearing of the Status Register. They also enable block erase and program. The CUI is written by bringing WE# to low level and OE# is at high level, while CE# is at low level. Address and data are latched on the earlier rising edge of WE# and CE#. Standard micro processor write timings are used.

Alternating Background Operation (BGO)

The 32M-bit DINOR IV Flash Memory allows to read array from one bank while the other bank operates in software command write cycling or the erasing / programming operation in the background. Array Read operation with the other bank in BGO is performed by changing the bank address without any additional command. When the bank address points the bank in software command write cycling or the erasing / programming operation, the data is read out from the status register. The access time with BGO is the same as the normal read operation. BGO must be between Bank(I), Bank(II), Bank(III) and Bank(IV).

Output Disable

When OE# is at VIH, output from the devices is disabled. Data input/output are in a high-impedance (High-Z) state.

Standby

When CE# is at VIH, the device is in the standby mode and its power consumption is reduced. Data input/output are in a high-impedance (High-Z) state. If the memory is deselected during block erase or program, the internal control circuits remain active and the device consumes normal active power until the operation completes.

Deep Power Down

When RP# is at VIL, the device is in the deep power down mode and its power consumption is substantially low. During read modes, the memory is deselected and the data input/output are in a high-impedance (High-Z) state. After return from power down, the CUI is reset to Read Array, and the Status Register is cleared to value 80H.

During block erase or program modes, RP# low will abort either operation. Memory array data of the block being altered become invalid.

Automatic Power Down (Auto-PD)

The Automatic Power Down minimizes the power consumption during read mode. The device automatically turns to this mode when any addresses or CE# isn't changed more than 200ns after the last alternation. The power consumption becomes the same as the stand-by mode. During this mode, the output data is latched and can be read out. New data is read out correctly when addresses are changed.

BBR(Back Bank array Read)

In the 32M-bit DINOR IV Flash Memory, when one memory address is read according to a Read Mode in the case of the same as an access when a Read Mode command is input, another Bank memory data can be read out (Random or Page Mode) by changing another Bank address.

M5M29KB/T331AVP

33,554,432-BIT (4,194,304-WORD BY 8-BIT /2,097,152-WORD BY 16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

Software Command Definitions

The device operations are selected by writing specific software command into the Command User Interface.

Read Array Command (FFH)

The device is in Read Array mode on initial device power up and after exit from deep power down, or by writing FFH to the Command User Interface. After starting the internal operation the device is set to the read status register mode automatically.

Read Device Identifier Command (90H)

We can normally read device identifier codes when Read Device Identifier Code Command (90H) is written to the command latch. Following the command write, the manufacturer code and the device code can be read from A0 address 0H and 1H in a bank address, respectively.

Read Status Register Command (70H)

The Status Register is read after writing the Read Status Register command of 70H to the Command User Interface. Also, after starting the internal operation the device is set to the Read Status Register mode automatically.

The contents of Status Register are latched on the later falling edge of OE# or CE#. When status read is required, OE# or CE# must be toggled every status read.

Page Read Command (F3H)

The Page Read command (F3H) timing can be used by writing the first command and CE# falls VIL or changing the address(A20-A2) is necessary to start activating page read mode. This command is fast random 4 words read. During the read cycle operation it is necessary to fix CE# low and change addresses which are defined by A0 and A1(or A-1 to A1) at random continuously.

The mode is kept until RP# is set to VIL or this chip is powered down.

The first read of Page Read timing is the same as normal read (ta(CE)). CE# should be fallen VIL. The read timing after the first is fast read (ta(PAD)).

In the page read mode the upper address(A20-A2) is supposed not to be clocked during read operation. Otherwise the access time is as same as normal read.

Clear Status Register Command (50H)

The Erase Status, Program Status and Block Status bits are set to "1"s by the Write State Machine and can only be reset by the Clear Status Register command of 50H. These bits indicate various failure conditions.

Block Erase / Confirm Command (20H/D0H)

Automated block erase is initiated by writing the Block Erase command of 20H followed by the Confirm command of D0H. An address within the block to be erased is required. The WSM executes iterative erase pulse application and erase verify operation.

Program Commands

A) Word / Byte Program (40H)

Word / Byte program is executed by a two-command sequence. The Word/Byte program Setup command of 40H is written to the Command Interface, followed by a second write specifying the address and data to be written. The WSM controls the program pulse application and verify operation.

B) Page Program for Data Blocks (41H)

Page Program allows fast programming of 128 words/ 256 bytes of data. Writing of 41H initiates the page program operation for the Data area. From 2nd cycle to 129th cycle(Word mode)/ 257th cycle(Byte mode), write data must be serially inputted. Address A6-A0(Word mode)/ A6-A-1(Byte mode) have to be incremented from 00H to 7FH. After completion of data loading, the WSM controls the program pulse application and verify operation.

C) Single Data Load to Page Buffer (74H)

/ Page Buffer to Flash (0EH/D0H)

Single data load to the page buffer is performed by writing 74H followed by a second write specifying the column address and data. Distinct data up to 128word can be loaded to the page buffer by this two-command sequence. On the other hand, all of the loaded data to the page buffer is programmed simultaneously by writing Page Buffer to Flash command of 0EH followed by the confirm command of D0H. After completion of programming the data on the page buffer is cleared automatically.

M5M29KB/T331AVP

33,554,432-BIT (4,194,304-WORD BY 8-BIT /2,097,152-WORD BY 16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

Flash to Page Buffer Command (F1H/D0H)

Array data load to the page buffer is performed by writing the Flash to Page Buffer command of F1H followed by the Confirm command of D0H. An address within the page to be loaded is required. Then the array data can be copied into the other pages within the same bank by using the Page Buffer to Flash command.

Clear Page Buffer Command (55H/D0H)

Loaded data to the page buffer is cleared by writing the Clear Page Buffer command of 55H followed by the Confirm command of D0H. This command is valid for clearing data loaded by Single Data Load to Page Buffer command.

Data Protection

The 32M-bit DINOR IV Flash Memory has a master Write Protect pin (WP#). When WP# is at VIH, all blocks can be programmed or erased. When WP# is low, all blocks are in locked mode which prevents any modifications to memory blocks. Software Lock Release function is only command which allows to program or erase.

Suspend/Resume Command (B0H/D0H)

Writing the Suspend command of B0H during block erase operation interrupts the block erase operation and allows read out from another block of memory. Writing the Suspend command of B0H during program operation interrupts the program operation and allows read out from another block of memory. The Bank address is required when writing the Suspend/Resume Command. The device continues to output Status Register data when read, after the Suspend command is written to it. Polling the WSM Status and Suspend Status bits will determine when the erase operation or program operation has been suspended. At this point, writing of the Read Array command to the CUI enables reading data from blocks other than that which is suspended. When the Resume command of D0H is written to the CUI, the WSM will continue with the erase or program processes.

Erase All Unlocked Blocks Command (A7H/D0H)

The command sequence enable us to erase all blocks. The command can be used by writing Setup command A7H(1st cycle) and confirm command D0H(2nd cycle). The sequence is not valid in case of WP#=VIL.

Power Supply Voltage

When the power supply voltage is less than VLKO, Low VCC Lock-Out voltage, the device is set to the Read-only mode.

A delay time of 2 μ s is required before any device operation is initiated. The delay time is measured from the time Flash VCC reaches Flash VCCmin (3.0V).

During power up, RP# = GND is recommended. Falling in Busy status is not recommended for possibility of damaging the device.

Memory Organization

The 32M-bit DINOR IV Flash Memory is constructed by 2 boot blocks of 4K words/ 8K bytes, 6 parameter blocks of 4K words/ 8K bytes and 7 main blocks of 32K words/ 64K bytes in Bank(I), by 8 main blocks of 32K words/ 64K bytes in Bank(II) and by 24 main blocks of 32K words/ 64K bytes in Bank(III) and Bank(IV).

1) X can be VIH or VIL for control pins.

2) X at RY/BY# is VOL or VOH (Hi-Z).

*The RY/BY# is an open drain output pin and indicates status of the internal WSM. When low, it indicates that WSM is Busy performing an operation.

A pull-up resistor of 10K-100K Ohms is required to allow the RY/BY# signal to transition high indicating a Ready WSM condition.

	Mode	Address	Data ¹⁾ (DQ0-15),(DQ0-7)	Mode	Address A20-A18 A0		Data (DQ0-15),(DQ0-7)	Mode	Address Data (DQ0-15),(DQ0-7)
Read Array	Write	X	FFH						
Page Read	Write	X	F3H	Read	SA ⁵⁾		RD0 ⁵⁾	Read	SA+i ⁶⁾ RDi ⁶⁾
Device Identifier	Write	Bank ²⁾	90H	Read	Bank ²⁾	IA ³⁾	ID ³⁾		
Read Status Register	Write	Bank ²⁾	70H	Read	Bank ²⁾		SRD ⁴⁾		
Clear Status Register	Write	X	50H						
Suspend	Write	Bank ²⁾	B0H						
Resume	Write	Bank ²⁾	D0H						

1) In the case of Word mode(BYTE#=VIH), upper byte data (DQ15-DQ8) is ignored.

2) Bank=Bank address (Bank(I)-Bank(IV): A20-18)

3) IA=ID code address: A0=VIL (Manufacturer's code): A0=VIH (Device code), ID=ID code

4) SRD=Status Register Data

5) SA=A20-A2: Page Address, A1, A0(A1-A-1):voluntary address / RD0=1st Page read data

6) SA+i: Page address(is equal to 1st Page Address of A20-A2), A1,A0(A1-A-1): voluntary address / RDi: 2nd Page read data

Command List (WP# =VIH)

Command	1st Bus Cycle			2nd Bus Cycle			3rd-129th Bus Cycles (Word mode) 3rd-257th Bus Cycles (Byte mode)		
	Mode	Address	Data ¹⁾ (DQ0-15),(DQ0-7)	Mode	Address	Data ¹⁾ (DQ0-15),(DQ0-7)	Mode	Address	Data ¹⁾ (DQ0-15),(DQ0-7)
Word Program	Write	Bank ²⁾	40H	Write	WA ³⁾	WD ³⁾			
Page Program	Write	Bank ²⁾	41H	Write	WA0 ⁴⁾	WD0 ⁴⁾	Write	WAn ⁴⁾	WDn ⁴⁾
Page Buffer to Flash	Write	Bank ²⁾	0EH	Write	WA ⁵⁾	D0H ¹⁾			
Block Erase/Confirm	Write	Bank ²⁾	20H	Write	BA ⁶⁾	D0H ¹⁾			
Erase All Unlocked Blocks	Write	X	A7H	Write	X	D0H ¹⁾			
Clear Page Buffer	Write	X	55H	Write	X	D0H ¹⁾			
Single Data Load to Page Buffer	Write	Bank ²⁾	74H	Write	WA ³⁾	WD ³⁾			
Flash to Page Buffer	Write	Bank ²⁾	F1H	Write	RA ⁷⁾	D0H ¹⁾			

1) In the case of Word mode(BYTE#=VIH),Upper byte data (DQ15-DQ8) is ignored.

2) Bank=Bank address (Bank(I)-Bank(IV): A20-A18)

3) WA=Write Address, WD=Write Data

4) WA0, WAn=Write Address, WD0, WDN=Write Data.

Word mode (BYTE#=VIH) : Write address and write data must be provided sequentially from 00H to 7FH for A6-A0.

Page size is 128 words (128-word x 16-bit), and also A20-A7 (block address, page address) must be valid.

Byte mode (BYTE#=VIL) : Write address and write data must be provided sequentially from 00H to FFH for A6-A-1.

Page size is 256 Bytes (256-byte x 8-bit), and also A20-A7 (block address, page address) must be valid.

5) WA=Write Address: A20-A7 (block address, page address) must be valid.

6) BA=Block Address : A20-A12[Bank(I)], A20-A15 [Bank(II), Bank(III), Bank(IV)] must be valid.

7) RA=Read Address: A20-A7 (block address, page address) must be valid.

33,554,432-BIT (4,194,304-WORD BY 8-BIT /2,097,152-WORD BY 16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

Device ID Code

Pins	A0	DQ7	DQ6	DQ5	DQ4	DQ3	DQ2	DQ1	DQ0	Hex. Data
Code										
Manufacturer Code	VIL	"0"	"0"	"0"	"1"	"1"	"1"	"0"	"0"	1CH
Device Code (Top Boot)	VIH	"0"	"0"	"1"	"1"	"1"	"0"	"0"	"0"	38H
Device Code (Bottom Boot)	VIH	"0"	"0"	"1"	"1"	"1"	"0"	"0"	"1"	39H

In the case of word mode, The output of upper byte data (DQ15-DQ8) is "0H".

Absolute Maximum Ratings

Symbol	Parameter	Conditions	Min.	Max.	Units
VCC	VCC Voltage	With Respect to GND	-0.2	4.6	V
VI1	All Input or Output Voltage ¹⁾		-0.6	4.6	V
Ta	Ambient Temperature		-40	85	°C
Tbs	Temperature under Bias		-50	95	°C
Tstg	Storage Temperature		-65	125	°C
Iout	Output Short Circuit Current			100	mA

1) Minimum DC voltage is -0.5V on input / output pins. During transitions, the level may undershoot to -2.0V for periods <20ns. Maximum DC voltage on input / output pins is VCC+0.5V which, during transitions, may overshoot to VCC+1.5V for periods <20ns.

DC electrical characteristics

(Ta= -40 ~85 °C and Flash VCC=3.0V~3.6V, unless otherwise noted)

Symbol	Parameter	Test Conditions	Limits			Units
			Min.	Typ. ¹⁾	Max.	
ILI	Input Leakage Current	$0V \leq V_{IN} \leq V_{CC}$	-1.0		+1.0	μA
ILO	Output Leakage Current	$0V \leq V_{OUT} \leq V_{CC}$	-10		+10	μA
ISB2	VCC Stand by Current	VCC= 3.6V, VIN= GND/VCC, CE#= RP#= VCC ±0.3V		0.1	6	μA
ISB3	VCC Deep Power Down Current	VCC= 3.6V, VIN= VIL/VIH, RP#= VIL		5	25	μA
ISB4		VCC= 3.6V, VIN= GND or VCC, RP#= GND±0.3V		0.1	6	μA
ICC1	VCC Read Current for Word / byte	Vcc = 3.6V, VIN = VIL/VIH, RP# = OE# = WE# = VIH, CE# = VIL, Iout = 0mA	5MHz	20	30	mA
			1MHz	4	8	mA
ICC1P	VCC Page Read Current	Vcc = 3.6V, VIN = VIL/VIH, RP# = OE# = WE# = VIH, CE# = VIL, Iout = 0mA	5MHz	5	10	mA
ICC2	VCC Write Current for Word / byte	Vcc = 3.6V, VIN = VIL/VIH, RP# = OE# = VIH, CE# = WE# = VIL			15	mA
ICC3	VCC Program Current	VCC = 3.6V, VIN = VIL/VIH, CE#= RP# = VIH			35	mA
ICC4	VCC Erase Current	VCC = 3.6V, VIN = VIL/VIH, CE#= RP# = VIH			35	mA
ICC5	VCC Suspend Current	VCC = 3.6V, VIN = VIL/VIH, CE#= RP# = VIH			200	μA
VIL	Input Low Voltage		-0.5		0.4	V
VIH	Input High Voltage		2.4		VCC+0.5	V
VOL	Output Low Voltage	IOL = 4.0mA			0.45	V
VOH1	Output High Voltage	IOH = -2.0mA	0.85xVCC			V
VOH2		IOH = -100uA	VCC-0.4			V
VLKO	Low VCC Lock Out Voltage ²⁾		1.5		2.2	V

All currents are in RMS unless otherwise noted.

1) Typical values at Flash VCC=3.3V, Ta=25 °C.

2) To protect against initiation of write cycle during Flash VCC power up / down, a write cycle is locked out for Flash VCC less than VLKO. If Flash VCC is less than VLKO, Write State Machine is reset to read mode. When the Write State Machine is in Busy state, if Flash VCC is less than VLKO, the alteration of memory contents may occur.

33,554,432-BIT (4,194,304-WORD BY 8-BIT /2,097,152-WORD BY 16-BIT)
CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

Program / Erase Time

Parameter	Min.	Typ.	Max.	Units
Block Erase Time		150	600	ms
Main Block Write Time (Byte Mode)		2	8	sec
Main Block Write Time (Word Mode)		1	4	sec
Page Write Time		4	80	ms
Flash to Page Buffer Time		100	150	μs

Program Suspend / Erase Suspend Time

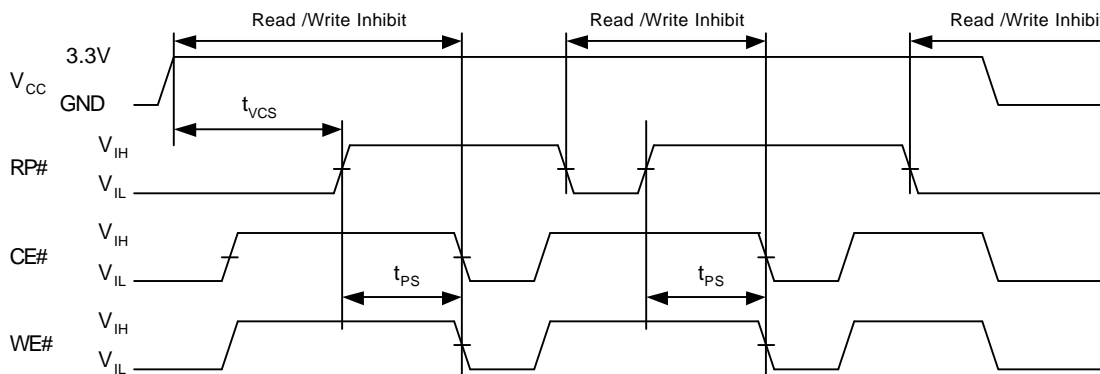

Parameter	Min.	Typ.	Max.	Unit
Program Suspend Time			15	μs
Erase Suspend Time			15	μs

Flash VCC Power Up / Down Timing

symbol	Parameter	Min.	Typ.	Max.	Unit
tVCS	RP#=VIH Setup Time from Flash VCC min.	2			μs

During power up / down, by the noise pulses on control pins, the device has possibility of accidental erase of programming. The device must be protected against initiation of write cycle for memory contents during power up / down. The delay time of min. 2 μsec is always required before read operation or write operation is initiated from the time Flash VCC reaches Flash VCC min. during power up /down. By holding RP#=VIL, the contents of memory is protected during Flash VCC power up / down. During power up, RP# must be held VIL for min. 2μs from the time Flash VCC reaches Flash VCC min.. During power down, RP# must be held VIL until Flash VCC reaches GND. RP# doesn't have latch mode, therefore RP# must be held VIH during read operation or erase / program operation.

Flash VCC Power up / down Timing

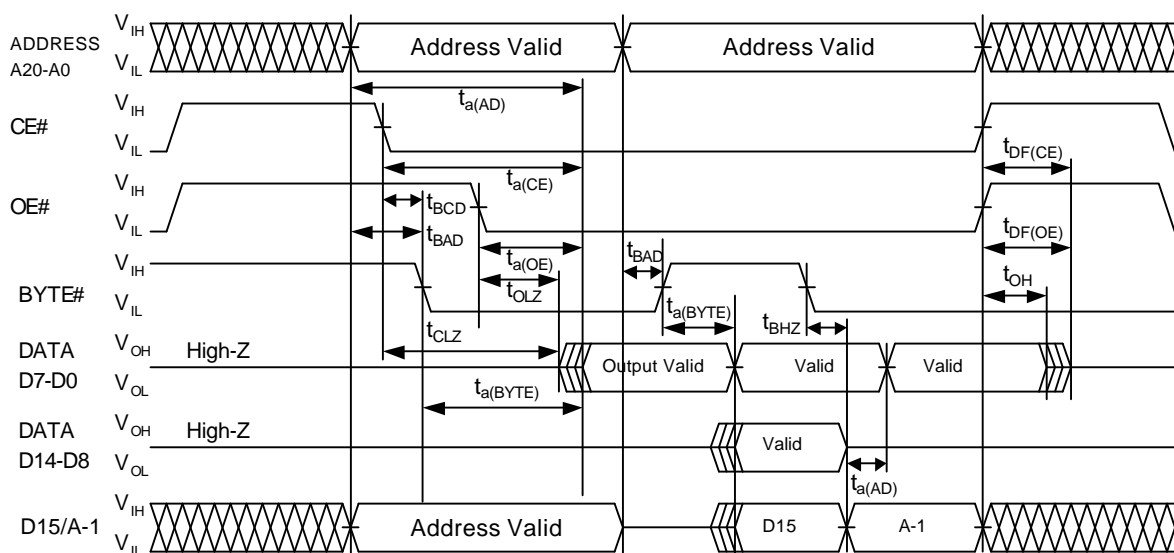

- After inputting Read Array Command FFH, it is necessary to make CE# "H" pulse more than 30ns (tCEPH). And after inputting Read Array Command FFH, it is also necessary to keep 30ns to recover before starting read after WE# rises "H" in case of changing address(es) and CE#="L".

AC waveforms for Page Read Operation

- After inputting Page Read Command F3H, it is necessary to make CE# "H" pulse more than 30ns (tCEPH). And after inputting Page Read Command F3H, it is also necessary to keep 30ns to recover before starting read after WE# rises "H" in case of changing address(es) and CE#="L".
- Once Page Read mode is valid, the mode is kept until RP# is set to VIL or the chip is powered off.
- Word mode(BYTE#=VIH):N=4. Byte mode(BYTE#=VIL):N=8

Byte AC Waveforms for Read Operation

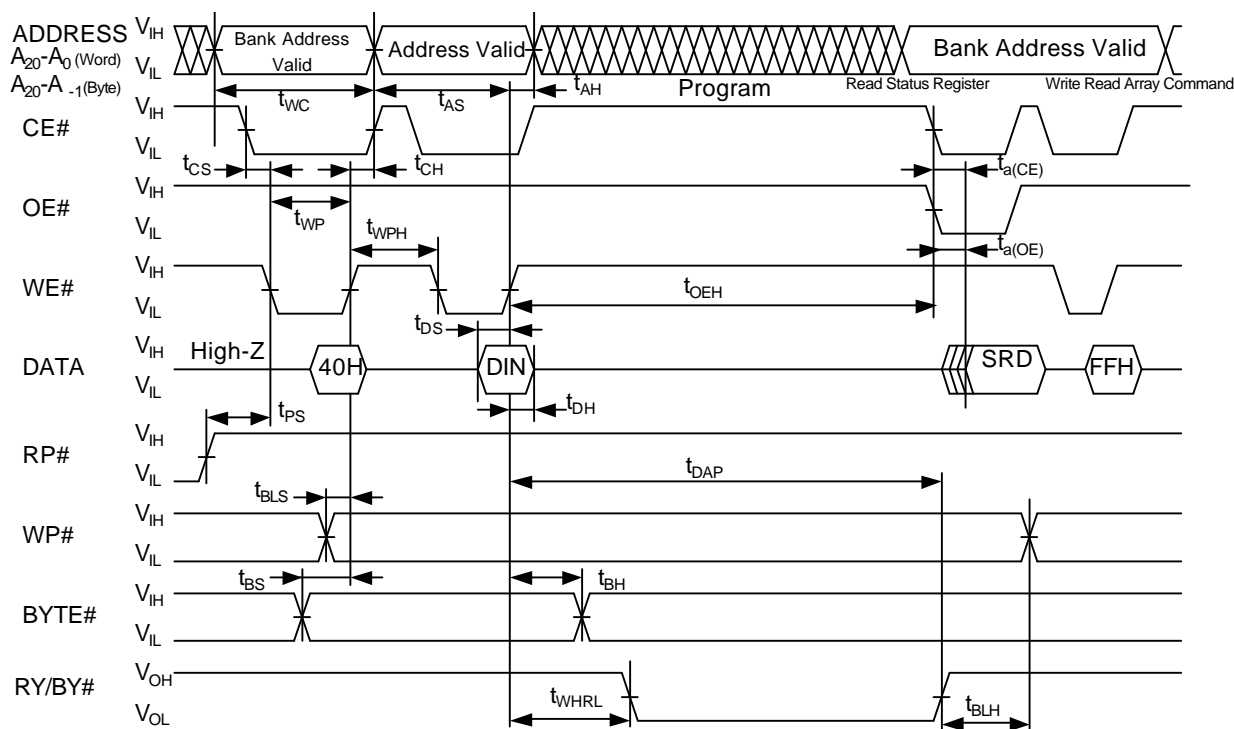

When BYTE# = VIH, CE# = OE# = VIL, D15/A-1 is output status. At this time, input signal must not be applied.

The timing diagram illustrates the sequence of operations for the 28C256C, including:

- Bank Address Valid:** The initial address phase where the bank address is established.
- Program in one bank:** The period during which data is programmed into the selected bank.
- Read Status Register:** The period during which the status register is read.
- Change Bank Address:** The point at which the bank address is updated to access a different bank.
- Read Array in another bank:** The period during which data is read from the new bank.

Key timing parameters shown include:

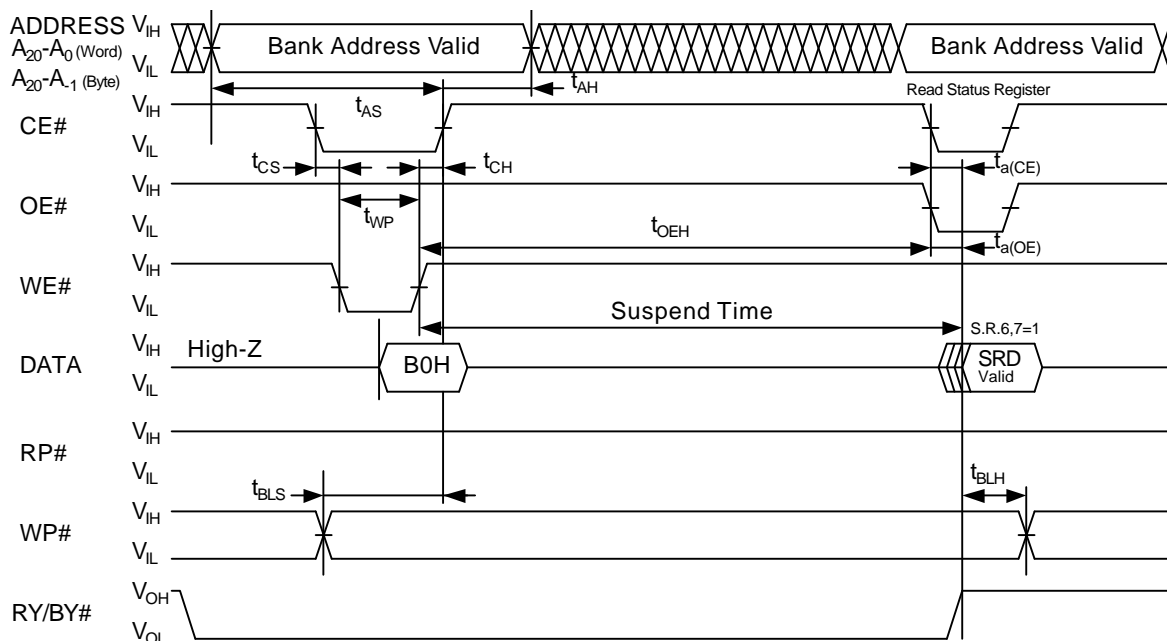

- t_{WC} : Write Cycle time
- t_{AS} : Address Setup time
- t_{AH} : Address Hold time
- t_{OEh} : Output Enable Hold time
- $t_{a(CE)}$: Access time for Chip Enable
- $t_{a(OE)}$: Access time for Output Enable
- t_{WS} : Write Strobe setup time
- t_{CEP} : Chip Enable Pulse width
- t_{WH} : Write Hold time
- t_{DS} : Data Setup time
- t_{EHRL} : Enable Hold time (Read Latency)
- t_{DH} : Data Hold time

The diagram also shows the data bus activity, including High-Z (High Impedance) and DOUT (Data Output) states.

CMOS 3.3V-ONLY, BLOCK ERASE FLASH MEMORY

Operation Status (WP#=VIH)

1) In case of Page Read, F3H is used instead of FFH in Operation Status ($WP\# = VIH$).

2) Once Page Read mode is set, Page Read mode is kept until power off or $RP\#$ is set to VIL.

3) After setting up Clear Page Buffer, D0H enables to clear Page Buffer.

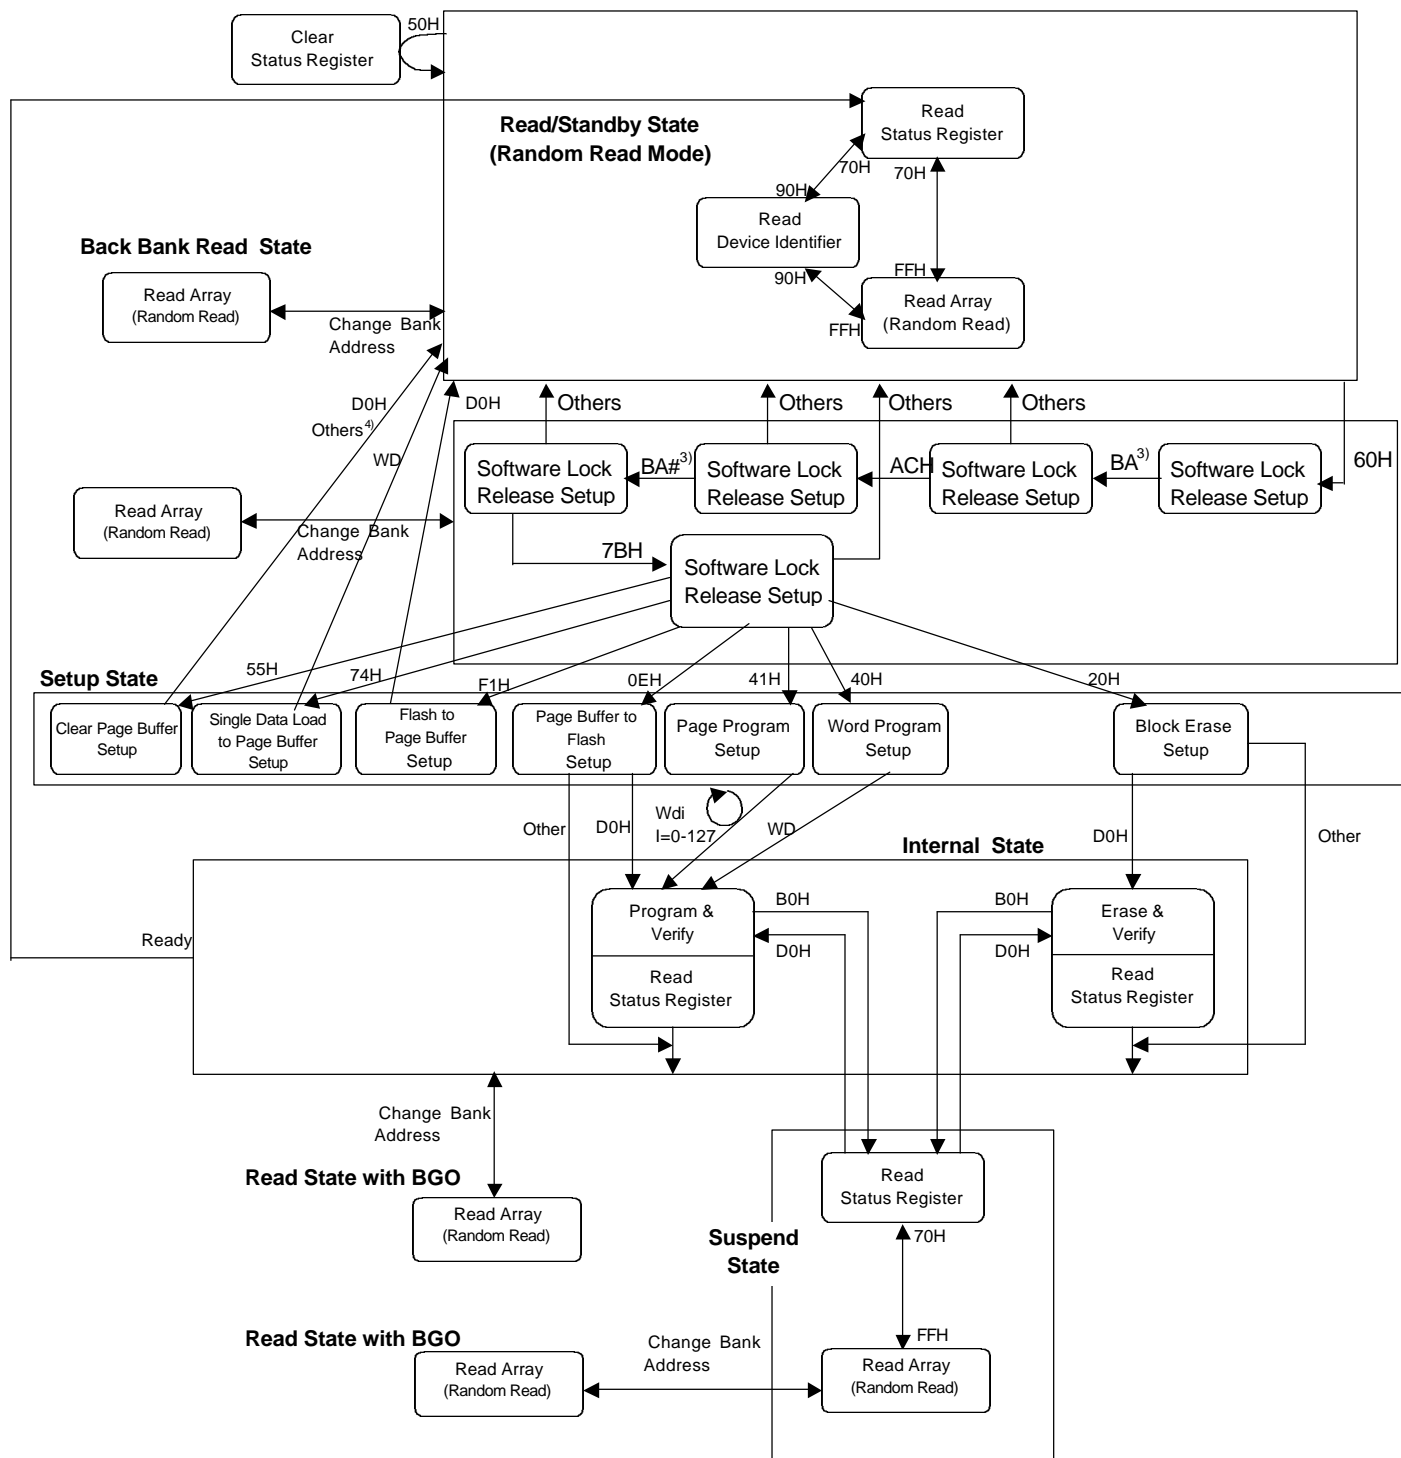

4) To access any bank during Erase All Unlocked Block results Status Register Read.

Although Read Status Register Command and Read Array Command can be issued under Suspend State, output data make no sense.

Operation Status (WP#=VIL)

- 1) In case of Page Read, F3H is used instead of FFH in Operation Status (WP#=VIL).
- 2) Once Page Read mode is set, Page Read mode is kept until power off or RP# is set to VIL.
- 3) BA, BA#: Block Address, Block Address# (Shown in Command List(WP#=VIL) in detail).
- 4) After setting up Clear Page Buffer, D0H enables to clear Page Buffer.

Keep safety first in your circuit designs!

- Renesas Technology Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitutive, auxiliary circuits, (ii) use of nonflammable material or (iii) prevention against any malfunction or mishap.

Notes regarding these materials

- These materials are intended as a reference to assist our customers in the selection of the Renesas Technology Corporation product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Renesas Technology Corporation or a third party.
- Renesas Technology Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts, programs, algorithms, or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams, charts, programs and algorithms represents information on products at the time of publication of these materials, and are subject to change by Renesas Technology Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor for the latest product information before purchasing a product listed herein.
The information described here may contain technical inaccuracies or typographical errors.
Renesas Technology Corporation assumes no responsibility for any damage, liability, or other loss rising from these inaccuracies or errors.
Please also pay attention to information published by Renesas Technology Corporation by various means, including the Renesas Technology Corporation Semiconductor home page (<http://www.renesas.com>).
- When using any or all of the information contained in these materials, including product data, diagrams, charts, programs, and algorithms, please be sure to evaluate all information as a total system before making a final decision on the applicability of the information and products. Renesas Technology Corporation assumes no responsibility for any damage, liability or other loss resulting from the information contained herein.
- Renesas Technology Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Renesas Technology Corporation or an authorized Renesas Technology Corporation product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Renesas Technology Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.
- Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Renesas Technology Corporation for further details on these materials or the products contained therein.
